Quick fix / maintenance guide
During use and aging the properties of a gas lift changes. Typical symptoms are tardy movement, or that the lift raises when the chair is not used.

Main reason is lack of cleaning and lubrication. In particular if the height is rarely adjusted.

However, a few useful tips that may renew the gas lift in an easy way. The tip is applicable both as regular cleaning and maintenance, and in order to “repair” gas lifts with reduced performance or failure.

**Step 1:**

a. Set the chair in its highest position.

b. Use a rag/cloth to remove dirt and old grease

c. Apply a thin layer of new grease

**Step 2:**

a. Release the lift by its handle.

b. Lower and raise the lift completely approx 10 times, while the lift is released the whole time.

**Lubricant:**
Any soap-based grease may be used.

If necessary it is also available from Flokk.
